EXECUTIVE SUMMARY

Trend Micro's Threat Hunting team has uncovered a new cyber espionage campaign by **Earth Preta (Mustang Panda)**, an advanced persistent threat (APT) group targeting government entities in the Asia-Pacific region. The attackers use a variant of the TONESHELL backdoor, leveraging legitimate software side-loading techniques and advanced evasion tactics to exfiltrate sensitive data. Earth Preta has been active since 2022, with over 200 victims, primarily targeting government agencies, political organizations, and critical infrastructure. Their evolving tactics indicate a highly sophisticated espionage operation, requiring immediate attention from security teams.

The attack begins with a spear-phishing email that delivers a malicious PDF decoy, distracting victims while the payload is executed in the background. The malware is sideloaded via Electronic Arts (EA) software and uses the Microsoft Application Virtualization Injector (MAVInject.exe) to inject its code into waitfor.exe when ESET antivirus is detected. Additionally, the Setup Factory installer is used to maintain persistence and avoid detection.

DETAILS OF THE INCIDENT

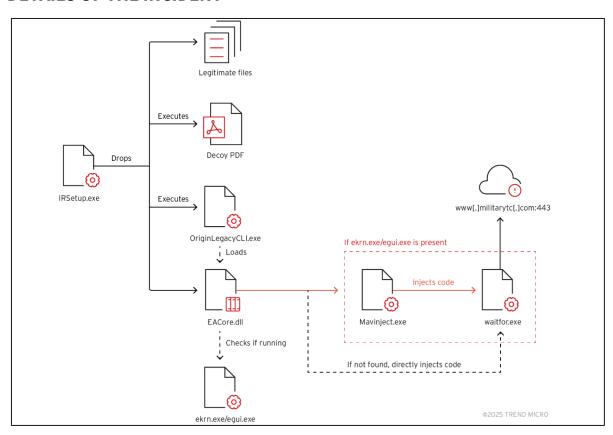

Figure 1: Infection chain of Earth Preta APT

Attack Chain and Execution

The initial access is gained through a spear-phishing email containing a malicious PDF designed to appear as a government or anti-crime initiative document.

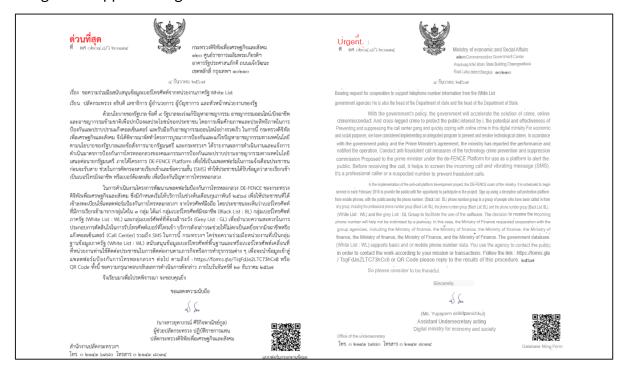

Figure 2: Decoy PDF (left) and translated text (right)

Once executed, the dropper (IRSetup.exe) installs both legitimate executables and malware components, hiding its presence.

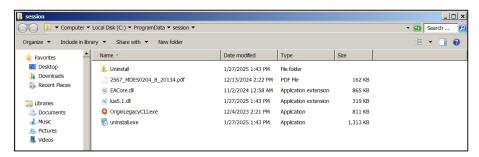

Figure 3: Files dropped by IRSetup.exe

```
offset aEacoreDll ; "EACore.dll
push
                       ; hModule
push
       0
push
                       ; char
       eax, [ebp+LibFileName]
lea
push
       800h
             ; int
push
       sub_40DB00
call
add
       esp, 14h
       ecx, [ebp+LibFileName]
lea
                       ; lpLibFileName
push
call
       ds:LoadLibraryW
mov
       [esi], eax
```

Figure 4: Loading the malicious DLL

The malware sideloads EACore.dll (TONESHELL backdoor) via Electronic Arts (EA) software.

The payload execution mechanism differs based on the presence of ESET security software:

If ESET is detected, MAVInject.exe is used to inject the payload into waitfor.exe.

```

Figure 10: Function to communicate with the C&C server

The malware extracts and decrypts shellcode from the .data section, which includes functionalities for establishing communication with its command-and-control (C&C) server at www.militarytc.com:443 to send system information, hostnames, and unique victim IDs.

Impact Analysis

- Compromised Government and Critical Infrastructure Systems The attack primarily affects Asia-Pacific government agencies, leading to data breaches and espionage activities.
- Stealthy Data Exfiltration By leveraging legitimate applications, the malware avoids detection and allows long-term persistence in compromised networks.
- Bypassing Security Defenses Earth Preta evades endpoint detection by using MAVInject.exe, avoiding signature-based detection.
- Widespread Espionage Threat Over 200 government entities have already been compromised, indicating a high level of targeting and success.

RECOMMENDED ACTIONS

Technical Mitigations:

- Enforce phishing detection and filtering to block emails with malicious attachments.
- Disable MAVInject.exe execution via group policy (GPO) unless explicitly required.
- Add C2 domains (www.militarytc.com) and IP addresses associated with Earth Preta to firewall blocklists.
- Prevent unauthorized DLL sideloading by monitoring abnormal process behaviors.
- Use behavioral analysis tools to detect process injection techniques and unauthorized registry modifications.

Organizational Recommendations:

- Educate personnel on phishing threats and encourage verification of unexpected emails.
- Conduct penetration testing and threat-hunting exercises to identify potential malware infection points.
- Restrict administrative privileges to minimize the risk of lateral movement within networks.

Incident Response Actions:

- Identify potential signs of malware injection within enterprise environments.
- Validate the integrity of legitimate EA applications and scan for unexpected DLL modifications.
- Integrate the latest threat intelligence reports on APT activities to enhance security defenses.
